Five-step architecture pattern selection process

Our group selected Micro-services Architecture for RP-Cloud Labs.

Step	Application to RP-Cloud Labs
1. Understand requirements and goals	We identified the need for students to access hosted learning tools through browsers without installing software locally.
2.Analyse domain	We identified separate responsibilities, including authentication, tool-session management, and licence management.
3. Evaluate patterns	We compared Client-Server, MVC, and Micro-services and selected Micro-services.
4. Weigh trade-offs	Micro-services provide independent development and scalability, but require more deployment and monitoring effort.
5. Prototype/PoC	We will build a simple frontend and API endpoint to demonstrate communication between the student interface and the Tool-Session Service.
